

Chester-Jensen Co., Inc.

Quality Heat Exchangers for the Dairy Industry Background:

Chester-Jensen has been pioneering fluid heat exchange technology since its inception in 1914. The diversity of product applications, developed over the years, has enabled us to serve a wide variety of markets including dairy, meat and poultry, food processing, pharmaceutical, chemical and allied industries worldwide.

Our reputation has grown by providing both the highest quality products available and the personalized attention to our clients' needs. Quality at Chester-Jensen has always meant durability, longevity of service and top performance.

The early days of service to the dairy industry taught us how to respond rapidly to meet the needs of increasingly stringent "sanitary" conditions.

All our products are manufactured exclusively in the USA. To our customers, this means assured availability, quicker delivery and immediate response with answers to questions.

Plate Heat Exchangers feature:

Heavy-duty, precisely designed frames available in SOLID stainless steel or specially coated carbon steel.

Both metal-to-metal and gasket supported plate designs available in either type 304 or type 316 stainless steel.

Single piece gaskets, molded from a variety of formulated elastomers, are selected to best meet application requirements.

Gaskets are bonded to plates, for trouble-free service, yet are easily replaced, in the field, without the need for special tools or chemicals.

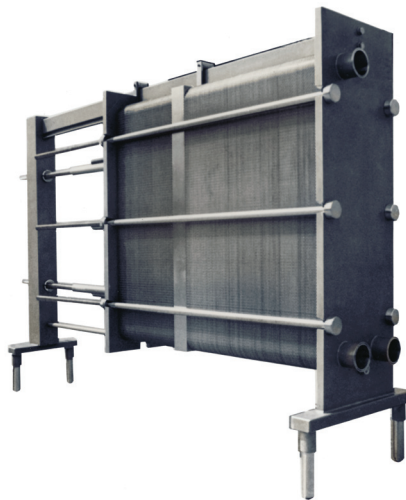

Standard six-bolt type closure with optional mechanical spindle or hydraulic assist closures available.

Differential operating pressures to 150 PSIG.

Computer designed configurations to process single, dual or multiple fluids and/or duties simultaneously.
