

GEA Westfalia Separator, Inc.

Founded in Germany over a century ago, GEA Westfalia Separator offers a full range of products in the dynamic filtration and separation categories, including high performance separators, clarifiers, decanters and membrane filtration systems.

Our equipment can be found in small and large dairy processing facilities. For small installations we offer Westfalia Separator® ecoplus, a concept based on modular machines that can be upgraded as processing volumes increase. At the other end of the spectrum is the MSE 600, the largest dairy separator in the world.

In 2009, a new separator design was introduced to the dairy industry. The design features an integrated direct drive system that is installed directly underneath the bowl in the separator's frame. This means that there are no radial forces and less strain on the bearings for a longer service life. The new design also allows the motor and drive to be exchanged in only a few hours. When compared to other drive options, the integrated direct drive provides a higher degree of efficiency and improved reliability. Other positive attributes include a smaller footprint and a low noise level.

Our engineers will work with customers to design complete processing lines for a variety of products including soft cheese and yogurt. Besides separators, the company manufactures butter churns, pasteurizers and milk standardization equipment.

We also offer Westfalia Separator capitalcare, a program developed to protect our customers' investments. This all encompassing program includes original spare parts, around-the-clock service and factory authorized repair facilities. The goal is to ensure safe operation and maximum performance over the life of the equipment. Further, GEA Westfalia Separator, is the only North American centrifuge company that offers full-service repair facilities for all its equipment on both the East and West Coasts.

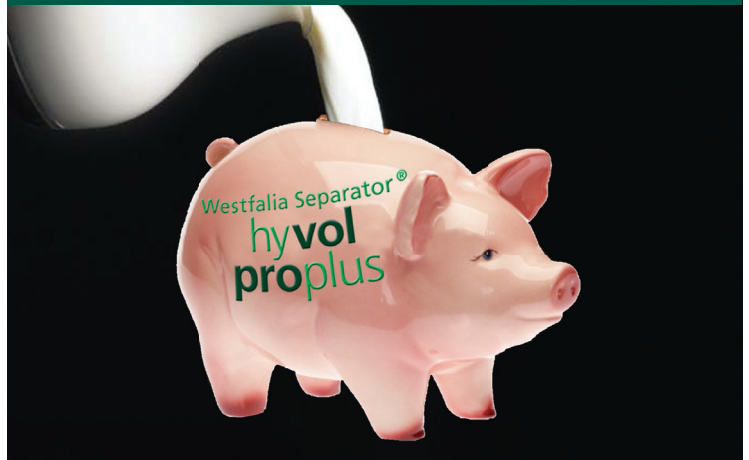

Westfalia Separator wewatch, is another special program available to our customers. This remote data collection and transmittal system continuously records centrifuge vibration and process data and interprets its meaning. It allows customers to eliminate unscheduled downtime by predicting and preventing equipment failures and diagnosing the root cause of a problem.

GEA Westfalia Separator

Cost Savings and Higher Yields You Can Take to the Bank

With the GEA Westfalia Separator hyvol proplus system, dairies can expect significant reduction in milk losses as well as savings in both operating water and waste disposal costs. But that's not all. Our patented process keeps more of the protein in the milk, allowing production of additional high value dairy products. And that's even better news for your bottom line. Couple these advantages with low maintenance and energy expenditures and you get a separator that delivers improved profits from the very start. To learn more about hyvol proplus separators, contact Chris Sandiford at 201-784-4334 or email him at Chris.Sandiford@geagroup.com.

Separation. Solution. Success.
