

Vigilistics

Vigilistics provides performance management software for the dairy and food processing industries. Vigilistics software helps reduce manufacturing costs, sends accurate production results to accounting systems, and provides auditable records for compliance.

Vigilistics software collects real-time data from existing plant floor systems. The process data is correlated into production transactions. Actionable business intelligence is then presented to management in reports focused on achieving performance improvement.

Vigilistics systems are in mission critical operation for fluid dairy, cheese, powdered milk, soup and other food processing applications.

Product loss, energy use, asset utilization, environmental and other operating costs are all targets for improvement. Dairy processors save as much as \$1 million per year in direct costs by reducing “shrink” during processing.
